

Cancelling a Production

How to call off a planned production and return its ingredients to stock

Applies to the Productions module · Version 1.0

1. What this is for

When you plan a production, the system immediately **reserves the ingredients** it will need, so they can't be double-booked by another plan. If that production then doesn't happen — the oven broke, staff didn't show, the day was a public holiday — those ingredients would otherwise stay locked up against a plan that will never be made.

Cancelling releases them. The moment you cancel, every ingredient reserved for that production goes straight back into available stock and can be used by another production, the same day.

Cancelling is not deleting

The record stays in the batch, clearly marked as cancelled, showing who cancelled it, when, and why. Nothing disappears from your history.

2. Who can cancel

Cancelling requires the `can_cancel_production` permission. If you don't have it, the Cancel buttons simply won't appear. An administrator can grant it under **Settings** → **Roles**.

3. Cancelling one product from a batch

Use this when most of the batch went ahead but one item didn't get made.

- 1 Go to **Productions** and find the batch.
- 2 Click **View Batch Details**.
- 3 In the **Products in Batch** table, find the product that wasn't made.
- 4 Click the red **Cancel** button on that row.
- 5 Type a short reason (optional but recommended — it's saved for the record).
- 6 Click **Cancel & release ingredients**.

The row immediately shows a grey `Cancelled` tag, and that product's ingredients are back in stock.

4. Cancelling a whole batch

Use this when the entire day's production was called off.

- 1 Go to **Productions** and find the batch.
- 2 Click **View Batch Details**.
- 3 Click **Cancel Batch** at the top right of the dialog.
- 4 Type a reason and confirm.

Every remaining product in the batch is cancelled together and all their ingredients are released at once. The batch status becomes **Cancelled**.

All-or-nothing

If even one product in the batch can't be cancelled (see Section 5), the whole action is refused and *nothing* is cancelled. This prevents a batch ending up half-cancelled. Cancel the eligible items individually instead.

5. When cancelling is not allowed

Cancellation is only for plans that never happened. The system will refuse in the situations below and explain why on screen.

Situation	What you'll see	What to do instead
Actual quantities already recorded	"...cannot be cancelled: actual production has already been recorded for it."	The goods physically exist, so this isn't a plan any more. Use Add / Edit Actual Production to correct the quantities.
Output already transferred, sold or given out	"...its output has already been used by transfer #x, sale #y."	Reverse or delete those transfers/sales first, then cancel.
Already cancelled	"...is already cancelled."	Nothing to do — it's done.

Why produced items can't be cancelled

Once actual production is recorded, real bread exists and may already have moved to an outlet. Cancelling would remove stock the shops are relying on. Correcting the actual quantities is the safe way to fix a mistake there.

6. What changes after cancelling

Where	What you'll notice
Ingredient stock	Reserved ingredients are available again immediately.
Batch Details	The product stays listed with a Cancelled tag. Hover it to see who cancelled it, when, and the reason.

Where	What you'll notice
Batch totals & status	Cancelled products no longer count towards the batch. A batch whose remaining products are all produced correctly shows Completed instead of being stuck on Pending .
Productions list	Cancelled items are hidden from the main list — Batch Details is where their history remains visible.
Audit Log	Records the cancellation with the user, time and reason.
Editing	A cancelled product can no longer be edited or given actual quantities.

7. Common questions

Can I undo a cancellation?

No. If the production does go ahead after all, add it again as a new product in the batch (or as a new batch) — the ingredients are back in stock, so it will reserve them again normally.

What if only part of the planned quantity was made?

Don't cancel. Record the actual production with the quantity that was really made — that's exactly what actual quantities are for. Cancelling is only for items where *nothing* was produced.

The Cancel button isn't showing.

Check in this order:

- Do you have the `can_cancel_production` permission?
- Has the item already had actual quantities recorded? (It will show **Produced**.)
- Is it already cancelled?

If you were granted the permission while already logged in, log out and back in — permissions are read at login.

Does cancelling affect the ingredients' cost or purchase records?

No. It only removes the reservation against those purchases. The purchase records, quantities and prices are untouched, and the ingredients return to the same purchase lots they were taken from.
